Product Overview

About Semaglutide / Cyanocobalamin Injection

Semaglutide / Cyanocobalamin Injection is a compounded medication that combines two distinct therapeutic agents to address metabolic health and nutritional support in a single formulation. This compounded preparation is available exclusively through our 503A compounding pharmacy pursuant to a patient-specific prescription and is tailored for individual patients based on their specific needs as determined by the prescribing physician.

As a compounded medication tailored for individual patients, Semaglutide / Cyanocobalamin Injection is prepared in sterile injection form. The medication is formulated in various strengths and vial sizes to accommodate physician determinations of patient need. This flexibility in dosing options allows healthcare providers to customize treatment regimens based on individual patient responses, tolerability, and therapeutic goals. By combining these agents in a single injection, the formulation may improve patient adherence to treatment protocols while potentially reducing the burden side effects or and multiple injections or medications, as determined by necessary by the prescribing physician.

It is essential to understand that Semaglutide / Cyanocobalamin Injection is available via patient-specific prescription from our 503A compounding pharmacy, which means it is prepared specifically for individual patients based on a physicians determination that the medication is necessary to treat the patient. This personalized approach to medication preparation allows for adjustments in concentration, volume, or other characteristics to meet specific patient needs, as determined by the prescribing physician, that may not be addressed by commercially available products. The compounding process follows quality standards and regulatory requirements to ensure the potency and sterility of the final product. Compounded medications, such as Semaglutide/Cyanocobalamin, are not FDA-approved medications, and FDA does not review compounded medications for safety or efficacy.

The injection vehicle is carefully selected to ensure compatibility with both active ingredients while maintaining appropriate pH, osmolality, and other physical characteristics necessary for subcutaneous administration. Quality control measures are implemented throughout the compounding process to verify the accuracy of ingredient measurements, sterility of the final product, and absence of particulate matter or other contaminants.

503A vs 503B

- 503A pharmacies compound products for specific patients whose prescriptions are sent by their healthcare provider.
- 503B outsourcing facilities compound products on a larger scale (bulk amounts) for healthcare providers to have on hand and administer to patients in their offices.

Expanding Access to Quality, Affordable Medication

Empower Pharmacy is the nation's premier 503A compounding pharmacy and 503B outsourcing facility. Our mission is to produce innovative medications that support our patients, practitioners, and pharmacies.

Compounded drug products from our 503A facility are available only through a valid prescription from your healthcare provider. Compounded drug products from our 503B facility are only available for order by licensed healthcare providers. Compounded products are not FDA-approved and have not been evaluated by the FDA for safety or efficacy. Shipping restrictions may apply.
